

Measurements techniques - 2018

1. 9702/11/M/J/18/No.4

In the circuit shown, an analogue ammeter is to be recalibrated as a thermometer. The ammeter is connected in series with a thermistor. The thermistor is a component with a resistance that varies with temperature. The graph shows how the resistance R of the thermistor changes with temperature T .

Which diagram could represent the temperature scale on the ammeter?

2. 9702/11/M/J/18/No.5

The sides of a cube are measured with calipers.

The measured length of each side is (30.0 ± 0.1) mm.

The measurements are used to calculate the volume of the cube.

What is the percentage uncertainty in the calculated value of the volume?

- A 0.01% B 0.3% **C 1%** D 3%

$$\frac{\Delta V}{V} = 3 \frac{\Delta L}{L}$$

$$= 3 \times \frac{0.1}{30}$$

$$= 0.01$$

$$\% = 0.01 \times 100$$

$$= \underline{\underline{1\%}}$$

3. 9702/12/M/J/18/No.3

A student measures the current through a resistor and the potential difference (p.d.) across it. There is a 4% uncertainty in the current reading and a 1% uncertainty in the p.d. reading. The student calculates the resistance of the resistor.

What is the percentage uncertainty in the calculated resistance?

- A 0.25% B 3% C 4% **D 5%**

$$R = \frac{V}{I}$$

$$\frac{\Delta R}{R} = \frac{\Delta V}{V} + \frac{\Delta I}{I}$$

$$= 4\% + 1\%$$

$$= \underline{\underline{5\%}}$$

4. 9702/12/M/J/18/No.4

A student applies a potential difference V of $(4.0 \pm 0.1)V$ across a resistor of resistance R of $(10.0 \pm 0.3)\Omega$ for a time t of $(50 \pm 1)s$.

The student calculates the energy E dissipated using the equation below.

$$E = \frac{V^2 t}{R} = \frac{4.0^2 \times 50}{10.0} = 80J$$

What is the absolute uncertainty in the calculated energy value?

- A 1.5J B 3J C 6J **D 8J**

$$\Delta E = 2 \frac{\Delta V}{V} + \frac{\Delta t}{t} + \frac{\Delta R}{R}$$

$$= 2 \left(\frac{0.1}{4} \right) + \frac{1}{50} + \frac{0.3}{10}$$

$$= 0.1$$

$$\Delta E = 0.1 \times E$$

$$= 0.1 \times 80$$

$$= \underline{\underline{8J}}$$

5. 9702/12/M/J/18/No.23

The diagram shows the screen of a cathode-ray oscilloscope (c.r.o.) displaying a wave.

The time-base of the c.r.o. is set at 10 ms/division.

What is the frequency of the wave?

- A 0.24 Hz B 4.2 Hz C 12 Hz **D 24 Hz**

$$T = L \times$$

$$= 4.25 \text{ div} \times 10 \frac{\text{ms}}{\text{div}}$$

$$= 42.5 \text{ ms}$$

$$f = \frac{1}{T}$$

$$= \frac{1}{42.5 \times 10^{-3}}$$

$$= 23.5 \text{ Hz}$$

$$\approx \underline{\underline{24 \text{ Hz}}}$$

6. 9702/13/M/J/18/No.4

What will reduce the systematic errors when taking a measurement?

- A adjusting the needle on a voltmeter so that it reads zero when there is no potential difference across it
- B measuring the diameter of a wire at different points and taking the average
- C reducing the parallax effects by using a marker and a mirror when measuring the amplitude of oscillation of a pendulum
- D timing 20 oscillations, rather than a single oscillation, when finding the period of a pendulum

7. 9702/13/M/J/18/No.5

In an experiment to determine the Young modulus E of the material of a wire, the measurements taken are shown.

mass hung on end of wire	$m = 2.300 \pm 0.002 \text{ kg}$
original length of wire	$l = 2.864 \pm 0.005 \text{ m}$
diameter of wire	$d = 0.82 \pm 0.01 \text{ mm}$
extension of wire	$e = 7.6 \pm 0.2 \text{ mm}$

The Young modulus is calculated using

$$E = \frac{4mgl}{\pi d^2 e}$$

where g is the acceleration of free fall.

(g is a constant, so has no effect on the calculation of ΔE .)

The calculated value of E is $1.61 \times 10^{10} \text{ Nm}^{-2}$.

How should the calculated value of E and its uncertainty be expressed?

- A $(1.61 \pm 0.04) \times 10^{10} \text{ Nm}^{-2}$
- B $(1.61 \pm 0.05) \times 10^{10} \text{ Nm}^{-2}$
- C $(1.61 \pm 0.07) \times 10^{10} \text{ Nm}^{-2}$
- D $(1.61 \pm 0.09) \times 10^{10} \text{ Nm}^{-2}$

$$\frac{\Delta E}{E} = \frac{\Delta m}{m} + \frac{\Delta l}{l} + \frac{2\Delta d}{d} + \frac{\Delta e}{e}$$

$$= \frac{0.002}{2.3} + \frac{0.005}{2.864} + \frac{0.02}{0.82} + \frac{0.2}{7.6}$$

$$= 0.0533$$

$$\Delta E = 0.0533 \times E$$

$$= 0.0533 \times 1.61 \times 10^{10}$$

$$= 8.6 \times 10^8$$

$$= 0.086 \times 10^{10}$$

$$= 0.086 \times 10^{10}$$

8. 9702/13/M/J/18/No.22

A cathode-ray oscilloscope (c.r.o.) is used to determine the frequency of a sound wave.

The diagram shows the waveform on the screen.

$$\begin{aligned}
 5 &\rightarrow 7 \text{ div} \\
 2 &\rightarrow ? \\
 \frac{2 \times 7 \text{ div}}{5} &= 2.8 \text{ div} \\
 T &= L \times c \\
 &= 2.8 \text{ div} \times \frac{5 \text{ cm}}{\text{div}} \\
 &= 14 \text{ ms} \\
 f &= \frac{1}{T} = \frac{1}{14 \times 10^{-3} \text{ s}} \\
 &= 71.43 \text{ Hz} \\
 &\approx \underline{\underline{71 \text{ Hz}}}
 \end{aligned}$$

The time-base setting is 5.0 ms/div.

What is the frequency of the sound wave?

- A 57 Hz **B** 71 Hz C 114 Hz D 143 Hz

9. 9702/12/F/M/18/No.5

A person calculates the potential difference across a wire by using the measurements shown.

Which measured quantity has the greatest contribution to the percentage uncertainty in the calculated potential difference?

	quantity	value	uncertainty
A	current / A	5.0	± 0.5
B	diameter of wire / mm	0.8	± 0.1
C	length of wire / m	150	± 5
D	resistivity of metal in wire / Ωm	1.6×10^{-8}	$\pm 0.2 \times 10^{-8}$

$$\begin{aligned}
 p.d &= IR \\
 \frac{\Delta V}{V} &= \frac{\Delta I}{I} + \frac{\Delta R}{R}
 \end{aligned}$$

$$\begin{aligned}
 \text{but } R &= \frac{\rho L}{A} \\
 &= \frac{\rho L}{\pi \left(\frac{d}{2}\right)^2} = \frac{4\rho L}{\pi d^2}
 \end{aligned}$$

$$\frac{\Delta V}{V} = \frac{\Delta I}{I} + \frac{\Delta L}{L} + 2 \frac{\Delta d}{d}$$

$$\frac{\Delta I}{I} = \frac{0.5}{5} = 0.1$$

$$\frac{\Delta L}{L} = \frac{5}{150} = 0.03$$

$$2 \frac{\Delta d}{d} = 2 \left(\frac{0.1}{0.8} \right) = \underline{\underline{0.25}}$$

$$0.25 > 0.1 > 0.03$$

10. 9702/12/F/M/18/No.6

A cathode-ray oscilloscope (c.r.o.) is connected to an alternating voltage. The following trace is produced on the screen.

$$A = 3.5 \text{ cm} \times \frac{2 \text{ V}}{1 \text{ cm}}$$

$$= 7.0 \text{ V}$$

$$T = 2 \text{ ms}$$

The oscilloscope time-base setting is 0.5 ms cm^{-1} and the Y-plate sensitivity is 2 V cm^{-1} .

Which statement about the alternating voltage is correct?

- A The amplitude is 3.5 cm.
- B The frequency is 0.5 kHz.
- C The period is 1 ms.
- D The wavelength is 4 cm.

$$T = 4 \text{ cm} \times 0.5 \text{ ms cm}^{-1}$$

$$= 2 \text{ ms}$$

$$f = \frac{1}{T} = \frac{1}{2 \times 10^{-3} \text{ s}}$$

$$= 500 \text{ Hz}$$

$$= 0.5 \text{ kHz}$$

$$\lambda = \frac{v}{f}$$
