

Dynamics (Newton Laws)

29 October 2020 08:43

Newton's 1st Law (law of Inertia) ✓

If resultant force is **Zero** i.e if forces are **balanced** ✓

✓ Rest → Rest ✓

Constant velocity → Constant velocity. ✓

i.e object maintains its "STATE"

Newton's 2nd Law ::

Force is equal to "rate of change of momentum" (define Force) ✓

Momentum ✓

- symbol P ✓ ✓
- vector quantity (direction important)
- defined as product of mass and ✓ velocity of an object
- formula $P = m \times v$ or $P = mv$
- units $\text{kg} \cdot \text{ms}^{-1}$ or
 $N \cdot s = (\text{kgms}^{-2}) \cdot s = \text{kgms}^{-1}$

$$F = \frac{\text{Change in momentum}}{\text{time}}$$

$$F = \frac{\Delta P}{t} \quad \rightarrow \quad \Delta P = F \times t$$

Impulse

$$F = \frac{p_f - p_i}{t}$$

$$F = \frac{mv - mu}{t}$$

$$F = m \left(\frac{v-u}{t} \right)$$

$$\text{Since } \frac{v-u}{t} = a$$

$$F = ma$$

define Impulse ::

product of force acting on an obj. and the time for which it acts

formula for Impulse

$$\text{Impulse} = F \times t$$

OR

$$\text{Impulse} = \Delta P$$

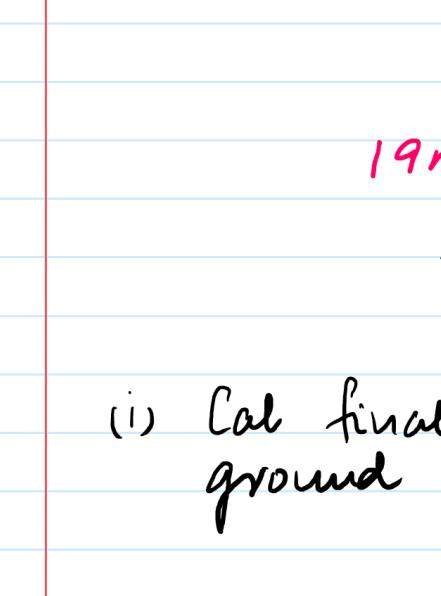

OR

$$\text{Impulse} = p_f - p_i$$

units of Impulse

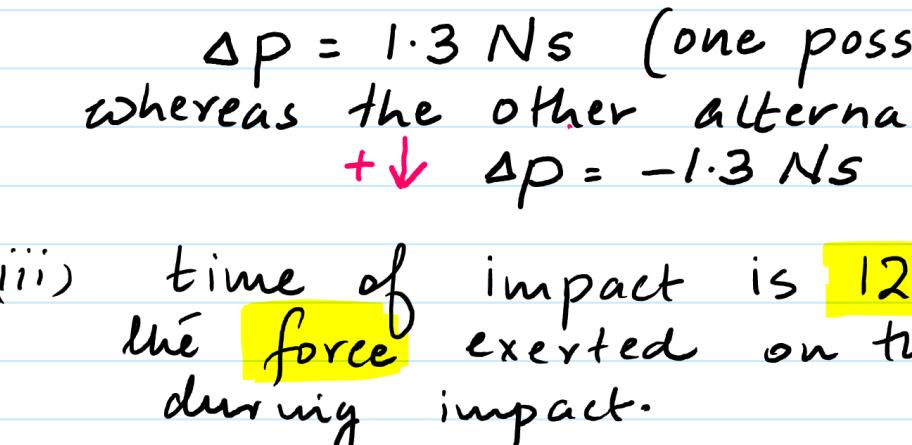

$$F \times t = N \cdot s$$

$$\Delta P = \text{kgms}^{-1}$$

Area under graph $F \times t = \text{Impulse}$ or ΔP .

• How to calculate change in momentum ΔP .

given that ball rebounds elastically

cal ΔP ?

$$\Delta P = p_f - p_i \quad \rightarrow \quad \Delta P = p_f - p_i$$

$$\Delta P = m \cdot v - m \cdot (-v) \quad \rightarrow \quad \Delta P = m(v) - m(-v)$$

$$\Delta P = 2mv$$

2mv to the left

$$\Delta P = -2mv$$

-2mv to the right

• Cal. ΔP if the ball did not rebound at all.

$$\Delta P = p_f - p_i \quad \rightarrow \quad \Delta P = p_f - p_i$$

$$\Delta P = 0 - m(-v)$$

$$= mv$$

$$\Delta P = 0 - mv$$

$$= -mv$$

?

• Cal the range of ΔP if ball rebounds inelastically.

answer should be in between the previous 2 answers i.e $mv < \Delta P < 2mv$

e.g. ②

$$u = 4.3 \text{ ms}^{-1}$$

$$t = 1.51 \text{ s}$$

to reach

the ground

$$19 \text{ m/s} \downarrow \quad 0 \quad 0 \uparrow 7 \text{ m/s}$$

(i) Cal final velocity as it hits the ground + ↓ $v = u + at$

$$v = 4.3 + (9.81)(1.51)$$

$$v = 19 \text{ m/s}$$

(ii) g. that it rebounds with speed of 7 m/s. Cal. the ΔP during impact.

$$m = 0.05 \text{ kg}$$

$$\Delta P = p_f - p_i$$

$$\Delta P = (0.05)(7) - (0.05)(-19)$$

(19)

$$\Delta P = 1.3 \text{ Ns} \quad (\text{one possible answer})$$

whereas the other alternate answer

$$+ \downarrow \quad \Delta P = p_f - p_i$$

$$\Delta P = 0 - (0.05)(-19)$$

$$\Delta P = 0.95 \text{ Ns}$$

$$\Delta P = -1.3 \text{ Ns}$$

(iii) time of impact is 12.5 ms. Cal. the force exerted on the ground during impact.

$$F = \frac{\Delta P}{t}$$

$$+ \uparrow \quad F = \frac{1.3}{12.5 \times 10^{-3}} = 104 \text{ N} \quad \text{one possible answer.}$$

otherwise

$$+ \downarrow \quad F = -104 \text{ N} \quad (\text{second possible answer}).$$

Ans.: mass = m

momentum = P

Kinetic energy = $K.E$

use formula for Kinetic Energy

and momentum to prove that

$$K.E = \frac{P^2}{2m}$$

Ans.:
