

Graphs of v/t , s/t and a/t for an object moving under the influence of gravity.

Q: An obj is projected vertically upwards with 30 m/s . It reaches its max. height & returns back to ground. Taking the upward direction as positive construct the graphs (ignore AR).

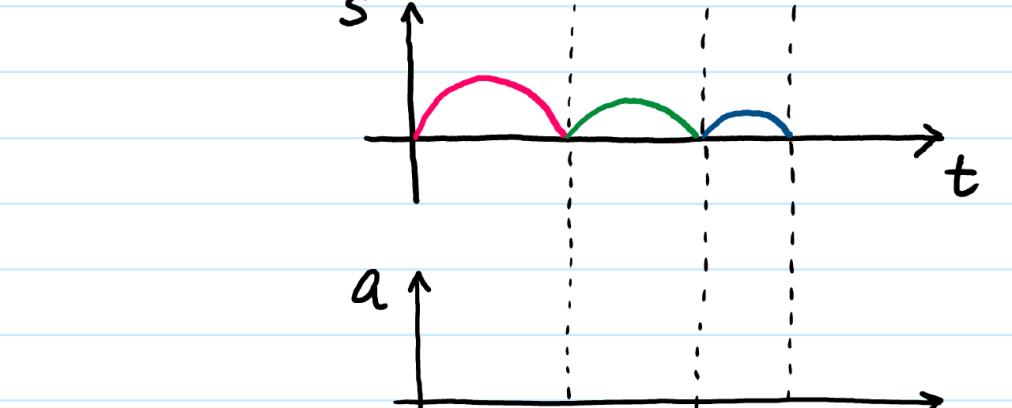

Q: A ball is released from rest. It hits the ground with 40 m/s & rebounds back to reach its starting pt. Taking \downarrow direction as positive sketch the following graphs (ignore AR).

$a = \text{constant}$
 $\uparrow +ve$; "a" acts down \therefore "a" neg.

Graph (in case of multiple bounces)

"multiple bounces."
collision is "Elastic"
Elastic \therefore No Loss of energy upon impact with the ground.

Same Condition but In Elastic Collision

In Elastic \therefore Loss of Energy upon Impact
